The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NG3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  LVTRHADVIPVRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 180
substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                        1 MKKKGSVVIVGRINLSGDTAYAQQTRGEQGTQRTSHTGRDKNQVEGEVQIVSTATQTFLA

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV Infection. This is useful as HCV can lead to chronic liver disease such as cirthosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-7
                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         120

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as antiviral treatments of the two proteins. Jiver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease: Inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAR 180
                                       Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis {\cal C}

                                                                                                                                                             The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the Y genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and

                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                           The present sequence is a mutated version of a fusion protein created using the Hepatitis C vitus (HCV) NS3 and NS4A procease enzymes. These proteins are both essential for the replication of the vitus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of the two proteins should be effective as chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                           TSINGVLWTVYHGAGTRTIASPKGPVTQMYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLY 120

The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A well as enabling structural studies of the protease and proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes. This sequence contains the alpha-helix0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             61 TSINGVLWTVYHGAGTRIIASPKGPVTQMYINVDKDLVGWQAPQGSRSLTPCTCGSSDLY

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ð
                                                                                                                                                                                                                                                The present sequence is a mutated version of a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and processes inhibitor complexes. This sequence contains the alpha-helix0-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           LVTRHADVIPVRRRGDSRGSLLSPRPISYLKGSSGGPLLCPAGHAVGIFRAAVSTRGVAK 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    28
                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a fusion protein created using the Hepatitis C virus (HCV) NS3 and NS4A protease enzymes. These proteins are both essential for the replication of the virus, acting to cleave its replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. Inhibitors of the two proteins should be effective as antiviral treatments of HCV infection. This is useful as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NCS mutents and NS3-MCS4 fusion proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease:inhibitor
                                                                                                                                                                    Modified hepatitis C virus (HCV) NS3 protease comprising at least 1 substitution of a hydrophobic alpha-helix 0 amino acid to a hydrophilic amino acid, useful for screening inhibitors that may treat hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 MKKKGSVVIVGRIVLNG--AYAQQIRGLLGCIITSLIGRDKNQVEGEVQIVSTAAQTFLA

The present sequence represents a specifically claimed example of the above complex. The covalent NSAA-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            22 GSVVIVGRIILSGSGSITAYSQQTRGLLGCKKTSLTGRDKNQVEGEVQVVSTATQSFLAT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         62 SINGVLWTVYHGAGTRIIASPRGPVT@MYTNVDKDLVGWQAPQGSRSLTPCTCGSSDLYL 121
                                                                                                                                                                                                                            The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4 serine protease domain, where the hydrophobic domain of native HCV NS3 perine protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       61

                                                                                                                                                                                                                                     NSAA NB3 complex comprising a central hydrophobic domain of native MSAA Peptide, a linker, and an HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 serine protease domain, where the hydrophobic domain of native HCV NS3 periods is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NSAA NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NSAA-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NSAA NSI complex comprising a central hydrophobic domain of native HCV NSAA Peptide, a linker, and an HCV NSI serine protease domain, where the hydrophobic domain of native HCV NSAA serine protease domain, where the hydrophobic domain of native HCV NSAA peptide is tethered by the linker to the amino terminus of the HCV NSI protease domain. The present sequence represents a specifically claimed example of the above domplexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NSI. The covalent NSAA.NSI complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61

The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the Arpase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a covalent hepatitis C virus (HCV) NS4A-NS3 complex comprising a central hydrophobic domain of native HCV NS4A-PST earlier protease domain, where the hydrophobic domain of native HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS4A peptide is tethered by the linker to the amino terminus of the HCV NS3 protease domain. The present sequence represents a specifically claimed example of the above complex. The covalent NS4A-NS3 complexes are useful for structural determination and determination of mode of binding of HCV inhibitors by NMR spectroscopy. They can also be used for detecting inhibitors of the protease activity, the helicase activity and the ATPase activity of NS3. The covalent NS4A-NS3 complexes are more soluble, stable and active than the non-covalent protease-peptide complexes previously available.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              83

A; Molecule type: genomic RNA
A; Residues: 1-547, T',549-621, V',623-624,'S',626-652,'DL',655-761,'T',763-782 < HOW>
A; Residues: 1-547, T',549-621,'V',623-624,'S',626-652,'DL',655-761,'T',763-782 < HOW>
A; Cross references: ExBL:x61591
A; Note: this sequence is inconsistent with the nucleotide translation
A; Note: the authors translated the codon AGG for residue 43 as Pro, TGG for residue
as TTP, and TTC for residue 771 as Ser
A; Note: sequence extracted from NCBI backbone (NCBIN:121747, NCBIP:121748)
C; Superfamily: hepatitis C virus genome polyprotein
C; Keywords: ATP: dytoprotein; hydrolase: nucleotide binding; P-loop; polyprotein; C; Keywords: ATP: dytoprotein; hydrolase: nucleotide depoly
F; 16-191/Product: envelope protein E $status predicted < NS1>
F; 190-729/Product: major envelope protein RS; *status predicted < NS1>
F; 130-127/Region: nucleotide-binding motif A (P-loop)
F; 1312-1317/Region: nucleotide-binding motif B
F; 1316-1319/Region: nucleotide-binding motif B

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A. Accession: PS0086
A. Molecule type: genomic RNA
A. Molecule type: genomic C. Stoperanily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein
C. Superfamily: hepatitis C virus genome polyprotein
F. 2-115/Product: capsid protein C *status predicted CPC>
F. 116-191/Product: major envelope protein E *status predicted CNSI>
F. 192-789/Product: nonstructural protein NSI *status predicted CNSI>
F. 1907-1615/Product: nonstructural protein NSI *status predicted CNSI>
F. 1907-1615/Product: nonstructural protein NSI *status predicted CNSI>
F. 1310-1317/Region: nucleotide-binding motif B
F. 1312-1317/Region: nucleotide-binding motif B
F. 1312-1317/Region: nucleotide-binding motif B
                                                                                                                                                                                                                                                                                                                              genome polyprotein - hepatitis C virus (strain J)
N;Contains: capsid protein C; envelope protein M; major envelope protein E; nonstructural protein NsContains: capsid protein C; envelope protein Ns4b; nonstructural protein NS4b; nonstructural protein NS5b; nonstructural protein NS4b; nonstructural protein NS5c; nonstructural NS5c; nonstructural

Genome polyprotein - hepatitis C virus (isolate HC-J6)

N; Contains: capsid protein C; envelope protein M; hepacivirin (EC 3.4.21.98) (nonstructured protein NS4s; nonstructural protein NS4b; nonstructural protein NS5

C; Species: hepatitis C virus

C; Species: hepatitis C virus

C; Accession: J01303

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (MSI); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.99-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4): Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate H) (HCV).
Viruses; SSRNA positive-strand viruscs, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        X-RAY CRYSTALLOGRAPHY (2.2 ANGSTROMS) OF 1192-1657.

-:- FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLITMERASE THAT PLAYS AN
ESSEMTIAL ROLE IN THE VIRUS REPLICATION.
-:- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-:- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                     SUBDIVIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY 1 LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    U
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         "Genomic structure of the human prototype strain H of hepatitis virus: comparison with American and Japanese isolates."; Proc. Natl. Acad. Sci. U.S.A. 88:10292-10296(1991).

The Talwanese hepatitis C virus genome: sequence determination and mapping the 5' termini of viral genomic and antigenomic RNA.";

Virology 188:102-113(1992).

-I- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS2B, NS4B AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-I- CATALYTIC ACTIVITY: Bydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in Pl and Ser or Ala in Pl'.

-I- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate + CANALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate + CANALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate + CANALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate - N di

Genome polyprotein (Contains casial protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3.4.22.-); Protease/hellcase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA Polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate Japanese) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;

THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                            Obkoshi S., Shimotohno K.;

"Molecular structure of the Japanese hepatitis C viral genome.";

FEBS Lett. 280:325-328(1991).

1- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

A Okamoto H., Okada S.-I., Sugiyama Y., Kurai K., Lizuka H.,
A Machida A., Miyakawa Y., Mayumi M.;
Machida A., Miyakawa Y., Mayumi M.;
Mucleotide sequence of the genomic RNA of hepatitis C virus isolated
from a human carrier: comparison with reported isolates for conserved
and divergent regions.
T. J. Gen. Virol. 72:2697-2704 (1991).
C -!- FUNCTION: THE SMALL PROFISING NSZA, NSZB, NSAA AND NS4B ARE
HYDROPHOBIC. SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 AMY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 AMY PLAY A ROLE IN THE VIRAL RNA REPLICATION.
OF CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral prestucing componing with Asp or Glu in the P6
possition, Cys or Thr in Pl and Sar or Ala in Pl'.
C -I- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                            01-AUG-1992 (Rel. 23, Created)

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein E1 (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P1 Northuctural protein NS2 (P21)
(EC 3.4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.22.-); Nonstructural protein NS4A (P4); Nonstructural protein
NS4B (P27); Nonstructural protein NS5A (P56); Nonstructural protein
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (Isolate HG-J8) (HCV).
                                                                                                                                                                                                                              SEQUENCE FROM N.A.
